Gretel Rajamoney

CS 493 – Assignment 2

Use a Web API

The GitHub API is RESTful, this is because we utilized the GET method to retrieve resources, the PATCH method to edit resources, the PUT method to add things to our resources, the POST method to create our resources, and lastly the DELETE method to remove our resources. The URL contained resources only, no verbs, a key factor in determining whether something is RESTful. The GitHub API is also classified as stateless, meaning that all of the calls were made independently and did not store any data within the server.
